FILE - In this June 3, 2013 file photo, Pakistani laborers bathe at a leaked water hydrant at the end of a day on

the outskirts of Islamabad. With each degree, unrestrained global warming will shingle the overall economies of three quarters of the nations in the world and widen the north-south gap between rich and poor countries, a new economic and science study found. Compared to what it would be without more global warming, the average income globally will shrivel 23 percent at the end of the century if heat-trapping carbon dioxide pollution continues to grow at current trajectories, according to a study published Wednesday in the scientific journal Nature.
