Kristof: Temperatures rise, and we’re cooked

Sunday, September 18, 2016

One of Donald Trump’s 100 wackiest ideas is that climate change is a hoax fabricated by China to harm the United States.

“The concept of global warming was created by and for the Chinese in order to make U.S. manufacturing uncompetitive,” Trump once tweeted.

He later said, unconvincingly, that he had been kidding about China, but he has emphasized that he does not believe in climate change and would end serious efforts to prevent it.

That obstinacy confronts a new wave of research showing that climate change is much more harmful than we had imagined.

Until now, the focus has been on rising seas, more intense hurricanes, acidification of oceans, drought and crop failures. But new studies are finding that some of the most important effects will be directly on our bodies and minds.

A clever new working paper by Jisung Park, a Ph.D. student in economics at Harvard, compared the performances of New York City students on 4.6 million exams with the day’s temperature. He found that students taking a New York State Regents exam on a 90-degree day have a 12 percent greater chance of failing than when the temperature is 72 degrees.

The Regents exams help determine whether a student graduates and goes to college, and Park finds that when a student has the bad luck to have Regents exams fall on very hot days, he or she is slightly less likely to graduate on time.

Likewise, Park finds that when a school year has an unusual number of hot days, students do worse at the end of the year on their final exams, presumably because they’ve learned less. A school year with five extra days of temperatures greater than 80 degrees leads students to perform significantly worse on final exams.

Heat affects our bodies as well as our minds: As temperatures rise, people die. In India, a rise of 1.8 degrees Fahrenheit in average daily temperatures leads to a 10 percent increase in the annual mortality rate. Even a single extra hot day leads to a noticeable jump in mortality. In the U.S., heat kills. A single day above 90 degrees increases the monthly mortality rate by more than 1 percent, according to research by Olivier Deschenes and other economists.

We just don’t function as well when the mercury goes up. When the temperature rises above 85 degrees, Americans who work outside cut their time in the heat by about an hour. Even in auto factories, most presumably air-conditioned, a week of six days above 90 degrees reduces production by 8 percent.

Perhaps more startling, rising temperatures seem to cause more violence.

“The relationship is really clear,” said Edward Miguel, an economist at the University of California, Berkeley, who has studied the issue. “Extremes in climate lead to more violence, more killing, more war, more land riots in Brazil, more sectarian violence in India. It’s pretty stunning how the relationship between climate and violence holds across the globe.”

“High temperatures,” one study finds, are “lowering inhibitions against retaliation.”

On hot days, murders go up with the temperature. Likewise, researchers find that police officers are more likely to draw and fire their weapons during a training session conducted on a hot day.

In Tanzania in any season, elderly women are sometimes accused of witchcraft and hacked or beaten to death. Miguel has found that unusual weather linked to climate change — either drought or heavy rainfall — is associated with a doubling in the number of these “witch” killings.

It appears that 2016 will be the hottest year in recorded history. But it’s not just that the mercury is going up; fundamentally, we are creating a hotter world for which we humans are poorly adapted.

So it’s time for Trump — and all Americans — to re-evaluate. Climate change isn’t a hoax, and it certainly isn’t a Chinese conspiracy. Unless we act, we’re cooked!
